

Acebrophylline Uses

Acebrophylline is used in the treatment and prevention of asthma and chronic obstructive pulmonary disease.

Acebrophylline comprises of theophylline-7 acetate and ambroxol which makes it effective in making the mucus more fluid and clearing the airways easily, thereby making breathing easier. This effect of Acebrophylline works as an added advantage over theophylline. Moreover, it also reduces the need for other medicine used to treat asthma, like salbutamol

How Acebrophylline works

Acebrophylline is a mucolytic and bronchodilator. It works by relaxing the muscles of the airways and also thins and loosens mucus, making it easier to breathe.

Common **side effects** of Acebrophylline

Nausea, Headache, Vomiting, Upset stomach, Restlessness

Precaution and advice

You have been prescribed Acebrophylline for prevention and treatment of asthma and chronic obstructive pulmonary disease (COPD).

It should be taken at the same time each day, preferably in the evening after food.

It does not work right away and should not be used to relieve sudden breathing problems. Always keep a fast-acting (rescue) inhaler with you.

Your doctor may take regular blood test to monitor potassium level and the level of this medicine in your body.

Notify your doctor if you have ever been diagnosed with kidney, liver or heart disease, or if you have a smoking history. Your dose may need to be adjusted.

Do not discontinue use without consulting your doctor, even if you feel better.
